Polynucleotide sequences AAF74187 - AAF74218 encode proteins AAB80608 - AAB80639, which impart environmental stress resistance. The invention relates to a method for identifying DNA encoding proteins imparting environmental stress resistance. The method comprises inserting convironmental stress resistance. The method comprises inserting cDNA from a library originating in a salt-resistant organish into a host cell; culturing the transformants under conditions in which the untransformed host does not grow well, and selecting for viable clones. The method is useful for obtaining DNA encoding environmental stress resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening method to obtain DNA encoding environmental stress resistance factor, useful for producing transgenic plants resistant to environmental
                                                                                                                                                                                                                                                                                                                                                                                                                  Environmental stress resistance, salt, heat, desert, transgenic plant,
                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding evironmental stress tolerant protein SEQ ID 39.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

factors. The DNA encoding proteins conferring environmental stress resistance, can be used in the production of plants resistant to environmental stress, which can be cultivated in unfavourable environments such as deserts, alt damaged ground, cold regions and the cerans. They can be used for increasing the area of land covered by green plants, and desert greening and afforestation, in order to counter the effects of the increase in atmospheric carbon dioxide concentration. PCR primers AAF74219 and AAF74220 are used in an example illustrating the method of the invention. (Updated on 66-AUG-2003 to correct OS field.) The present sequence is a DNA encoding spinach S-adenosyl-L-methionine: phosphocthanolamine N-methyltransferase (FEMAT). The PEMAT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphomono-methylethanolamine, choline, phosphocholine, choline, calliphe or glyquine betaine. They are useful for altering the lipid content in plant cells. The polymucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprocectant properties of a plant and increasing the cryoprocectant properties of a plant and increasing the altering searches of a plant and increasing the altering searches and compositions comprising PEMAT used for generating transgenic plants with increased

The present invention describes isolated tocopherol and carotenoid metabolism related proteins (TCMRP) (1) from mosses or algae, used as enzymes in the production of fine dhemicals or in the metabolism of coopherols and carotenoids. (1) also assist in transmembrane transport. The fine chemicals that can be produced include lipids, fatty acids, vitamins, cofactors, enzymes, amino acids, and nucleotide bases.

Nucleotide sequences, proteins, vectors and host cells from the present nucleotide agenences, proteins, vectors and host cells from the present patens; (b) in mapping genomes of mosses related to Physcomitralla patens; (c) in the medulation of from a function; (d) in evolutionary studies; (e) in the determination of functional TCMRP regions; (f) and in the cellular production of functional TCMRP regions; (f) and in the physocomitralla patens TCMRP proteins given in AAB98449 to AAB9889.

Cellular production of functional TCMRP regions; (f) and in the AAB44211 represent uncleotide sequence used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                           556
                                                                                                                                                                                                                9
choline, phosphocholine, phosphatidylcholine, choline-O-sulphate or glycine betaine. They are useful for altering the lipid content in plant cells. The polynucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprotectant properties of a plant. The present invention also relates to methods and compositions comprising PEAMT used for generating transgenic plants with increased nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CCTAGGTTCTACACCAAGATCTTCAAAGAATGCCATATGCAAGATGATTCTGGGAACTCC

The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence expresents an oligonucleotide clone DNA sequence featured in the specification. The specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 432
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                575
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       492
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         515
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                552

(SNP). The oligomucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligomucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed sepecification, but was obtained in electronic format directly from WIPO at Etp.wipo.int/pub/published-pct-sequences. Barley; single nucleotide polymorphism; SNP; genotype-phenotype analysis DNA clone originating in barley containing SNP encoding sequence #9389.

(first entry)

```
The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The specification, but was obtained in electronic format directly from NIPO at fip.wipo.int/pub/published-pct-sequences

Arabidopsis thaliana sequences (1) as given in specification e.g. 360, 137, 455, 219, 472 nucleotides, etc. or its fragment. (1) is useful as a complementary modelies of the fragment. (1) is useful as a late of hybridisation probe to complementary modelies in a cDNA library. (1) is useful as a late of useful for generating genetically modified and transgenic organisms, cusually plant cells and plants. A proten encoded by (1) is useful in a creening assays to determine the effect of candidate inhibitors.

CC screening assays to determine the effect of candidate inhibitors, activators or modifiers of the gene product. The protein is also useful for screening biologically active easiers e.g., fungicides and nucleic acid, where the nucleic acid comprises transcription regulatory sequences operably linked to a sequence capable of hybridising under stringent conditions to (1) is useful in the study of genetic function and regulation, for alteration of the cellular metabolism and for screening product. This sequence represents an Arabidopsis thaliana compounds that may affect the biological function of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CACCAAGATAACTACCTGATAACTCTTTTGATGTCATCTATAGCCGTGACACATTCT 1022

The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP): The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAAGAAGAACGICCIGAGAIICIIIICAAIGCIICCGCCICIIGAAGGAAAAIGCCICIIG 120

```
barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The specification, but was obtained in electronic format directly from NIPO at fip.wipo.int/pub/published-pct-sequences

The present invention relates to oligonucleotide clones originating in barley (bordenw vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an equence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed at Etp.wipo.int/pub/published-pot-sequences. The oligonucleotides may be used for analysis of SNBs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The specification, but was obtained in electronic format directly from WIPO at ftp wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

(SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The specification, but was obtained in electronic format directly from WIPO at trp. wilpo.int.pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                             562

The present invention relates to oligonucleotide clones originating in barley (bordenm vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype ranalysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed at the number of the printed at the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GAAAAHGCATCCTTCATGTGTGTGTTACATCTCCAGACCTGGTGATTGAGGACAAC 388

Concrowganisms or fungi, plants, or its fragments [1] can be used as enzymes in the production of fine chemicals or in the metabolism of tocopherols and carotenoids. [1] also assist in transmembrane transport. The fine chemicals that can be produced include lipids, fatty acids, vitamins, cofactors, enzymes, amino acids, and nucleotide bases.

Concludencide sequences, proteins, vectors and host cells from the present invention can be used: [a) to identify moses related to Physcomitrella patens; (b) in mapping genomes of mosses related to Physcomitrella patens; (c) in the endulation of from acinity; (d) in evolutionary studies; (e) in the determination of functional TCMRP regions; (f) and in the cellular production of functional TCMRP regions; (f) and in the cellular production of functional patens to AMH4422 to AMH4422 concode the AMH4412 to AAH4421 represent invention

This sequence is the direct result of the Base calling software
This sequence is the high quality insert the software Lucy
(default parameters). It is the raw base calls. To aid in the
identification of the high quality insert the software Lucy
(default parameters) has been run on this sequence. Lucy identified
the region [65,863].

Plate: Taltr07 row: K column: 02.

                                                                                                                                                                              ઠે
                                                                                                         Anotes Crgan: Bud; Vector: pDNR; Site 1: Sfil; Site 2:
Sfil; CABUD is a cDNA library of Vitis vinifers cv.
'Cabernet Sauvignon' Clone 8 dissected buds. Samples were
collected May 13, 2002 from pre-bloom plants (10-11 days
before bloom), pre-veraison. Sampled vines were located
the University of California, Davis, Experimental
Vineyard. OPNA were made by oligo-dr priming and
directionally cloned. 5'and 3' adaptors were used in
cloning as follows:
5'-AAGCAGTGGTATCAACGCCGATAACGCCGGG-3' and
5'-ATCTAGAGCCGAGCGCCATAACGCCGGG-3'. Library was
constructed using the Clontech Creator SWART kit and
size-selected to contain the 0.5-3 kb size fraction."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      181 TyrGluLeuSerLeuLeuSerCyBLysCyBlleGlyAlaTyrValArgAsnLyBLysAsn 200.

//note="vector: pBRCDNASfiAB; The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TNG_LIBE-QH_ABCDI sunflower RHAB01

Site_2: XhoI; The library was prepared from polyA+ RNA from pollen at the late vacuolated-vacuolated stage of development. Pollen was harvested from greenhouse-grown panicles of sorghum line Brx623. Panicles were removed from the flag leaf prior to emergence, when no detectable amylase is present in pollen of male-fertile lines. This stage represents pollen collected from anthers about 8-14 days prior to anthesis. Double-stranded cDNA was cloned unidistructionally into different Draili sites of the pME185-FL3 vector (5-prime Draili site is CACTGTGT). 3-prime Draili site is CACCATGTG, 3-prime Draili site is CACCATGTG). XhoI excises the cDNA insert."	Alignment Scores: 5.02e-119 Length: 721 Pred. The invention relates to a method for identifying DNA encoding proteins imparting environmental stress resistance. The method comprises inserting cDNA from a library originating in a salt-resistant organism into a host cell, culturing the transforments under conditions in which the untransformed host does not grow well, and selecting for viable clones. The method is useful; for Volkaining DNA encoding proteins conferring environmental stress resistant to ensed in the production of plants resistant to environmental stress environmental stress environmental stress.

New plant S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase polypeptides, useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine and for altering the lipid content in plants cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Spinach; S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase; PEAMT; cellular intermediate; phospho-dimethylethanolamine; choline; phosphomono-methylethanolamine; phosphocholine; phosphotatidylcholine; glycine betaine; choline-0-aulphate; lipid content alteration; osmotic stress tolerance; nutritional value; transgenic plant;
                                                                                                                                                                                                                                                                                        The present sequence is S-adenosyl-L-methionine:phosphoethanolamine N-methyltzansferase (PEAMT) truncated protein from spinach. The PEAMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylerhanolamine, phosphomono-methylerhanolamine, choline, phosphocholine, phosphosphothethylerhanolamine, phosphocholine, phosphosphothethylerhanolamine, choline, phosphocholine, phosphatidylcholine, choline-O-sulphate or glycine betaine. They are useful for altering the lipid content in plant cells. The polymucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprotectant properties of a plant. The present invention also relates to methods and compositions comprising PEAMT used for generating transgenic plants with increased nutritional value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /nore= "This residue is given as Lys in the sequence shown as SEQ ID NO: 2 in figure 3 of the specification"

environments such as deserts, salt damaged ground, cold regions and the oceans. They can be used for increasing the area of land covered by green plants, and desert greening and afforestation, in order to counter the effects of the increase in atmospheric carbon dioxide concentration. PCR primers AAF74219 and AAF7420 are used in an example illustrating the method of the invention. (Updated on 06-AUG-2003 to correct OS field.)

New plant S-adenosyl-L-methionine:phosphoethanolemine N-methyltransferase polypeptides, useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine and for altering the lipid content in
                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase (PEMMT) procein from spinach. The PEMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphocholine, phosphomono-methylethanolamine, choline, betaine. They are useful for altering the lipid content in plant cells. The polymucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the exyoprotectant properties of a plant and increasing the exyoprotectant properties of a plant and increasing the exyoprotectant properties of a plant and increasing the area of a plant and increasing transgenic plants with increased
                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 109; 158pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes isolated tocopherol and carotenoid metabolism related proteins (TCMP) [1] from mosses or algae, microorganisms related proteins (TCMP) [1] from mosses or algae, microorganisms or fungi, plants, or its fragments. [1] can be used as enzymes in the production of fine chemicals or in the metabolism of tocopherols and carotenoids. [1] also assist in transmembrane transport. The fine chemicals that can be produced include lipids, farty acids, vitamins, cofactors; enzymes, admino acids, and nucleotide bases. ... in Nucleotide sequences, proteins, vectors and host cells from the present invention can be used: [a) to identify mosses related to Physcomitrella patens patens; (b) in mapping genomes of mosses related to Physcomitrella patens
          The present invention relates to oligonucleotide clones originating in barley (Bordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tocopherol and carotenoid metabolism related protein; TCMRP; synthesis; Physicomitrella patens; moss; algae; microorganism; fungus; plant; identification; genome mapping; modulation; evolutionary study; cellular production; fine chemical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tocopherol and carotemoid metabolism related protein (TCMRP), used to produce fine chemicals, is isolated from mosses, algae, microorganisms, fungi, plants, or their fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bischoff F;

The present invention describes isolated tocopherol and carotenoid metabolism related proteins (TCMRP) [1] from moses or algas.

microorganisms or fungi, plants, or its fragments. [1] can be used as enzymes in the production of fine chemicals or in the metabolism of coopbarols and carotenoids. [1] also assist in transmembrane transport. The fine chemicals that can be produced include lipids, fatty acids, vitamins, cofactors, enzymes, amino acids, and mucleotide bases.

Nucleotide sequences, proteins, vectors and host cells from the present invention can be used: (a) to identify moses related to Physcomitrella patens; (b) in mapping genomes of moses related to Physcomitrella patens; (c) in the medulation of fructional TCMRP regions; (f) and in the cellular production of functional TCMRP regions; (f) and in the cellular production of functional TCMRP regions; (f) and in the cellular patens TCMRP proteins given in AMB99849 to AMB99889.

Barley, single nucleotide polymorphism; SNP; genotype-phenotype analysis

Hordeum vulgare. WO2003057877-A1. 17-JUL-2003

DNA clone originating in barley containing SNP sequence #872.

17-OCT-2003 (first entry)

ABM74462;

```
The present invention relates to oligomucleotide clones originating in barley (Hordemu vulgare) which contain single mucleotide polymorphisms (SNP). The oligomucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligomucleotide clone sequence fastured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                              Using a gene expressing sterol methyl transferase 1 to increase the level of sterols in plant seeds or decrease cholesterol level in plant tissue is useful to produce commercially desired plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the use of a gene expressing sterol methyl transferase I (SMTI) to increase the level of sterols in plant seeds or decrease cholesterol level in plant tissue. SMTI genes of the invention are used to produce commercially desired plants and oilseeds where the plant tissue contains reduced cholesterol and the oilseeds where the sterols that may be extracted along with the oils. The present sequence is Nicotiana tabacum smtl (Ntsmtl) full length protein

                                                                                                                                                                                                                                                                                                                                                                                                  06-SRP-2000
                                                                                                                                                                                                    AAG21651;
                                                                                                                                                RESULT
                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters of more plant, sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypoptides or nucleic acids encoding them are useful for herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                        Gape

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N;Alternate names: S-adenosyl-methionine-sterol-C-methyltransferase
C;Species: Richius communis (castor bean)
C;Decies: Ciolul-1999 #sequence_revision 16-Jul-1999 #text_change 03-Jun-2002
C;Accession: T10173
